Sprint 4

Medicaid Employment Verification Application

November 4, 2026

Team C#

Lessons Learned (1)

During our previous sprint, our team continued working on the Missouri Medicaid project. Our goal was to improve the application process and make it easier for applicants to submit documents and for Medicaid employees to review and verify those documents.

We worked on understanding the business process, organizing project requirements, and developing the Medicaid Document Portal.

Lessons Learned (2)

- Communication and Team Coordination

  One challenge was coordinating different responsibilities among team members. Each member had a different role, including development, database, documentation, and web design. Making sure everyone understood their responsibilities was important.

  2. Understanding Project Requirements

  Some project requirements needed more discussion and clarification. We needed to understand how applicants submit documents and how Medicaid employees review, verify, and update document statuses.

Lessons Learned (3)

- Development and Integration

  Connecting the different parts of the project, including the database, user interface, and application requirements, required careful planning. We needed to make sure the different parts supported the same business process.

- What We Learned

Our team learned that communication, planning, and teamwork are important for completing a successful project. We also learned that understanding the business process before developing the application can prevent confusion and unnecessary change

Lessons Learned (4)

- Conclusion

Overall, the previous sprint helped our team understand areas that need improvement. In the next sprint, we plan to improve communication, clarify requirements, test our work, and keep our documentation organized. These improvements will help us develop a more useful and reliable Medicaid Document Portal.

User Stories for Sprint 4

User Story	Medicaid Employee	Medicaid Employee	Medicaid Applicant	Database Developer
Description	As a Medicaid Employee, I want to view a recipient's employment hours, employer information, and any other needed documentation in one place so that I can quickly verify whether the recipient meets the work requirement for Medicaid eligibility.	As a Medicaid employee, I want to be able to notify an applicant if their provided documentation is not suitable to be used for verification.	As a Medicaid recipient, I want to be able to see the status of my submitted verification documents so that I can know whether my information has been accepted or if I need to provide something else.	As a software developer on this project, I want to get the MEVA web app to a state where it can be tested by non-developers.
Priority	High	Medium	High	High
Time Required	2 sprints, 2 people, 20 hours	1 sprints, 1 person, 5 hours	2 sprints, 1 person, 12 hours	3 sprint, 2 person, 30 hours

Code Updates / Testing findings (4 and 8)

This week's focus was on extending usability of the App for mobile users, and making submitted applications available to Medicaid Employees for review.

The Application Status page has been connected to the backend and is now ready to be further designed on the front end.

Accomplished this Sprint:

- Application available to employee to review (not approve yet)
- Application status now shown to applicant
- Site is now useable on mobile devices
- Site is now live and hosted by Azure at: Home Page - MedicaidEmploymentVerificationApplication
- Code for completed work can be found at: Hadas-26/C---System-Analysis-Design

Testing was done by Josh Green, and all users who took the Survey Monkey survey (discussed on the following slides).

Survey Monkey findings (5-1)

Question 1

How easy was it to navigate the web app?

Our mean score was 95.8% for this question.

Question 2

Describe any issues you face during the verification process.

Most respondents said they experienced no issues while one said the first page loaded slowly, which is expected behavior on Azure's free tier.

Question 3

What did you like most about the web app?

Several respondents mentioned that it was easy to use/navigate. One called the website "smooth."

Survey Monkey findings (5-2)

Question 4

What improvements would you suggest for the web app?

Most provided no suggestions, and one said that "On one of the pages the top portion of the page was moveable from the bottom page," which I couldn't interpret.

Question 5

Please rate the visual appeal of the app.

Out of 5 stars, our mean rating was 5 stars

Question 6

How satisfied were you with the speed of the web app?

Out of all the respondents, our mean score was 97.2%.

Survey Monkey findings (5-3)

Question 7

Would you recommend this web app to others?

Our mean score for this question was only 77%.

Question 8

How likely are you to use this web app again?

Our mean score for this question was 78.2%, which I believe reflects that the app serves no purpose until it is more operational

Question 9

How would you describe your overall experience using the app?

Answers range from 10/10, to impressed, to satisfied, to lackluster.

Survey Monkey findings (5-4)

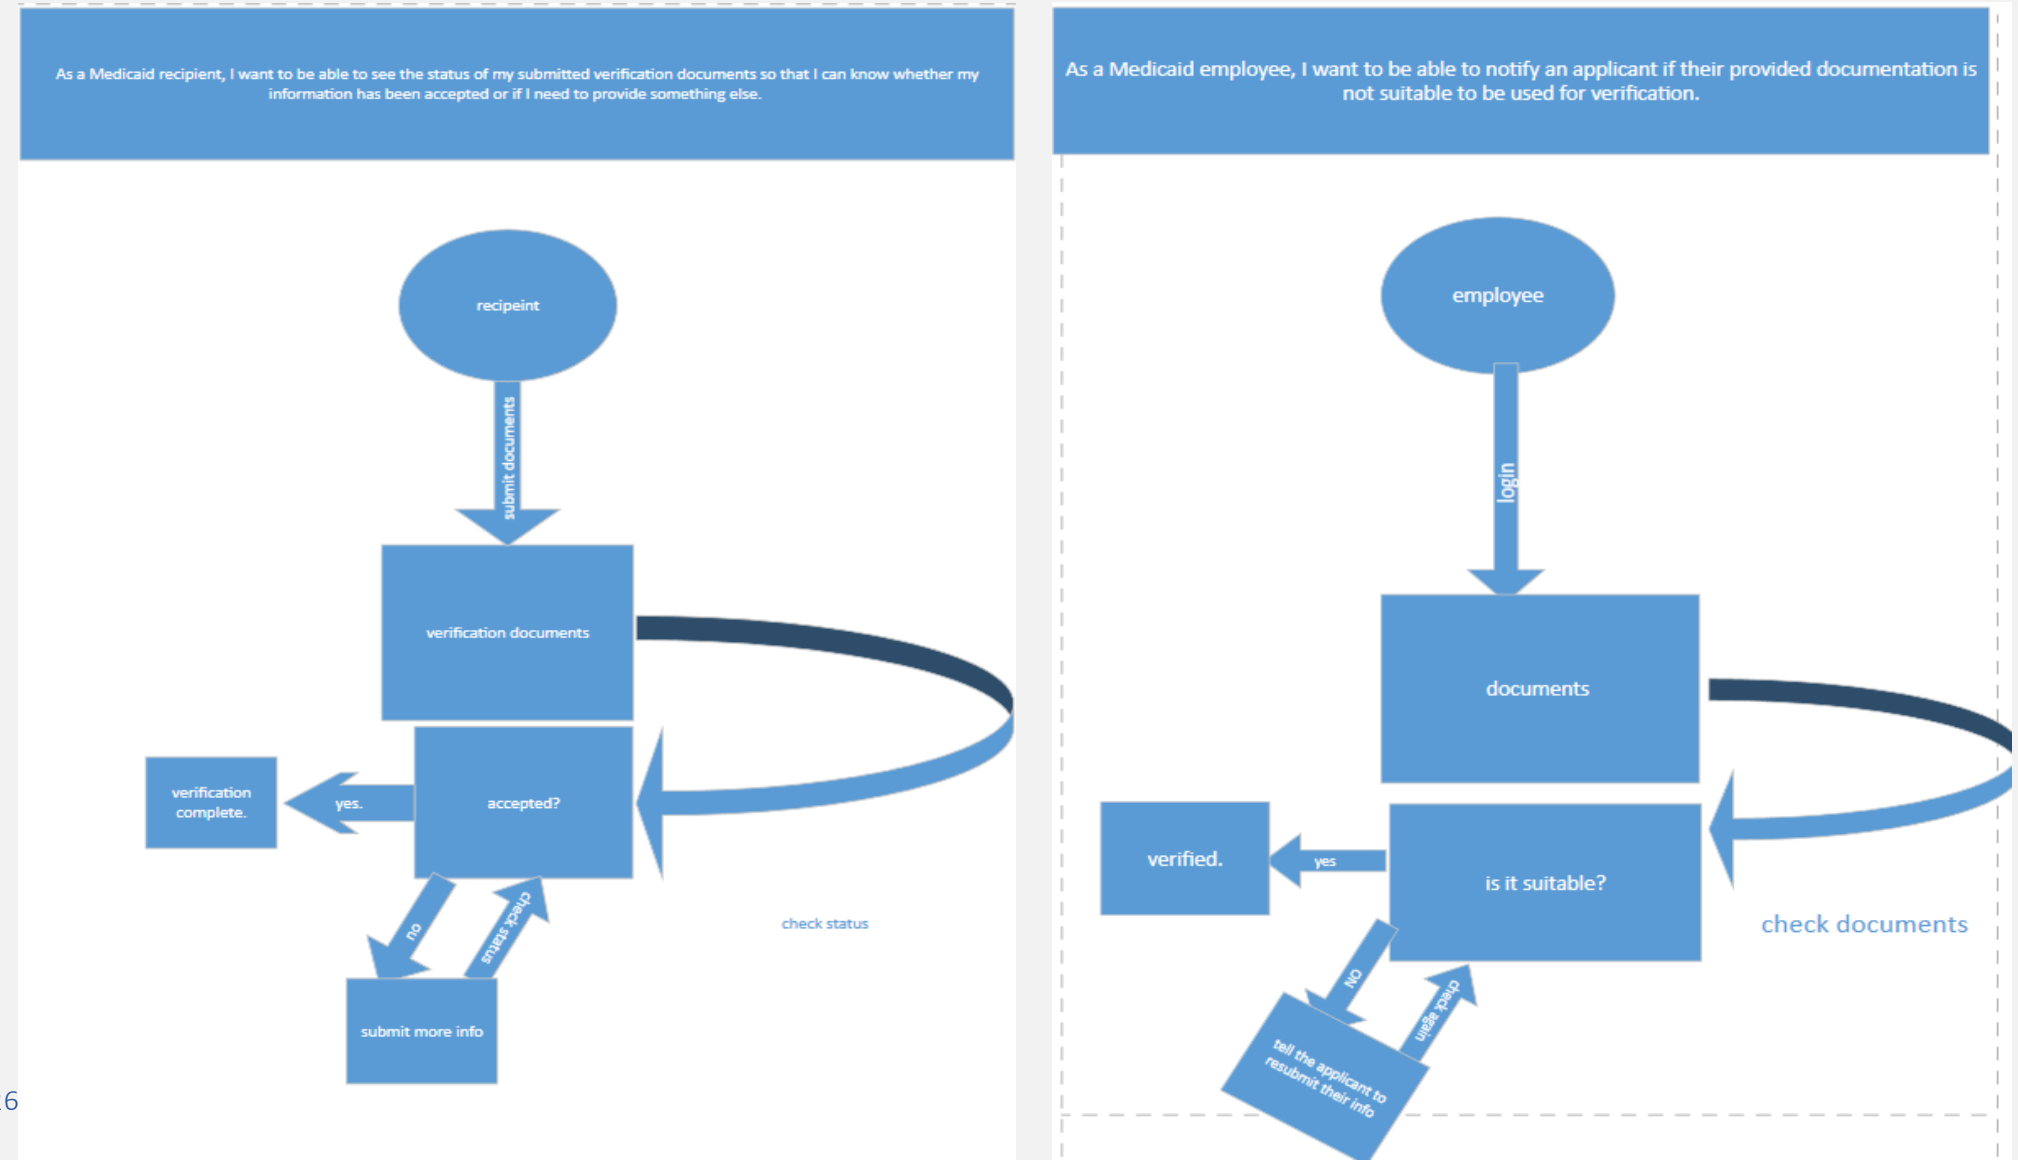

Question 10

Provide any additional comments or suggestions.

Almost all respondents said they have no comments or suggestions, while one suggests that "there could more access to things opening."

Documentation(8)

- Project Overview

  The Medicaid Document Portal is a web-based application prototype designed to help Medicaid employees manage and review documents submitted by applicants.

  The purpose of this application is to make the document verification process easier, more organized, and more efficient. It provides a central place where employees can view application information, review submitted documents, and track application statuses.

Documentation(8-1 What the Code Does)

- The code creates the user interface for the Medicaid Document Portal. It provides different sections to help users navigate the application and access important information. The main features include:
- Dashboard: Displays an overview of applications and document activity.
- Upload Documents: Provides an area for submitting or uploading required documents.
- Document Review: Allows employees to review applicant documents.
- Application Status: Helps employees track which applications are pending or completed.
- Profile: Displays user profile information.
- Help: Provides access to assistance and application information.
- The dashboard also displays summary information, such as total applications, pending reviews, and documents.

Documentation(8-2) Who Will Use the Application?

- The primary users of this application are: Medicaid Employees: Employees use the portal to review applicant information, verify submitted documents, and monitor application progress. Document Reviewers: Reviewers use the application to check submitted documents, identify missing information, and update document statuses. Applicants: Applicants are the intended users of the document submission process. They need a way to provide required documents and understand the progress of their applications.

Documentation(8-3)Platform Requirements for host

- The Medicaid Document Portal is designed as a web and mobile based application. Users will access the application through a web browser on a computer and phone.
- Software Requirements The expected software requirements include:
- Windows 10 or Windows 11 operating system.
- Microsoft Edge or Google Chrome web browser.
- Visual Studio Code or another code editor for development.
- HTML for creating the application structure.
- CSS for designing the user interface.
- JavaScript for interactive features, if implemented.
- A database management system may also be required for future development to store applicant information, submitted documents, and application statuses.

Documentation(8-4)-for user

- Hardware Requirements

  The recommended hardware requirements include:

  • A desktop computer or laptop.

  • A minimum of 4 GB RAM, with 8 GB recommended.

  • A modern processor.

  • Internet connection.

  • Sufficient storage for application files and documents.

- Mobile device

Documentation(8-5)

- **Security and Future Improvements**

  Because the application involves personal and employment information, security is important.

  Future development should include:

  • Secure employee login and authentication.

  • Different access permissions for employees and applicants.

  • Protection of personal and confidential information.

  • Secure document storage.

  • Database integration.

  • Error handling and application testing.

Documentation(8-6)

- Conclusion

  The Medicaid Document Portal is designed to improve the way Medicaid employees manage applicant documents and application information. The application provides an organized interface for document review and status tracking.

  Future development will focus on improving functionality, connecting the database, strengthening security, and testing the application to make sure it meets the needs of its users.

Recommendations / Additions

Recommendations

- The C# team recommends adding accessibility features for users who may need it.
- We recommend adding padding to the hamburger menu links to make them easier to click.
- Lastly, we recommend considering auto fill functionality for known information (first name, last name, email) in an application for users to save time.

Conclusion

Thank you for your time. We'd love to hear any feedback so that we can keep improving upon the Medicaid Employment Verification App!
